SUMMARY

Java Backend Engineer with 3+ years of experience building secure, high-throughput distributed systems. Designed OAuth 2.0 and OIDC authorization capabilities aligned to RFC specifications, implemented Kafka-based event flows across distributed services, and led performance engineering that cut response times 25% while sustaining 5000+ TPS. Builds REST APIs and microservices with Spring Boot and Spring Cloud, and works comfortably across Oracle SQL/PL-SQL, Cassandra, and other relational and NoSQL persistence layers.

TECHNICAL SKILLS

Languages: Java, Core Java, PL/SQL, Python, JavaScript, TypeScript, C#

Backend & Frameworks: Spring Boot, Spring Cloud, Spring Data JPA, Hibernate, WebSphere Application Server, REST APIs, SOAP, Microservices

Security & Auth: OAuth 2.0, OpenID Connect (OIDC), JWT, Token Issuance & Validation, RBAC, SSO, Secure Coding Practices

Databases & Persistence: Oracle (SQL/PL-SQL), Cassandra, PostgreSQL, MySQL, MongoDB, Redis, DAO Patterns, Query Optimization

Distributed Systems: Apache Kafka, Event-Driven Architecture, Service Discovery, API Gateway Routing, Caching, Database Replication

Performance & Observability: Load Testing, Heap-Dump Analysis, Connection Pooling, Splunk, Distributed Tracing, Incident Triage

Testing & Quality: JUnit 5, Mockito, Unit & Integration Testing, SonarQube, Code Reviews

AI & LLM Tools: OpenAI GPT-4, Google Gemini, Groq, LLM Agent Orchestration, Prompt Engineering, RAG Pipelines, MCP Integration

Cloud & DevOps: AWS, Azure, Docker, Kubernetes, Maven, Git, Jenkins, GitHub Actions, Agile/Scrum, SDLC

PROFESSIONAL EXPERIENCE

TekNexpert — Software Engineer

May 2025 – Present

- Built authentication and authorization services in Core Java and Spring on WebSphere, implementing OAuth 2.0 and OpenID Connect flows in line with RFC specifications to support enterprise integrations serving 10M+ daily requests.
- Designed token issuance and validation logic with scope- and claims-based access control, enabling stateless authorization across service-to-service calls without shared session state.
- Implemented Kafka-based event flows to propagate consent and authentication state across distributed services in real time, decoupling downstream consumers from the identity platform.
- Applied DAO design patterns with Hibernate and JPA over Oracle SQL/PL-SQL and Cassandra, tuning access paths for relational and wide-column workloads respectively.
- Led performance engineering across load testing, heap-dump analysis, connection pooling, caching, and database replication, cutting response times 25% while sustaining 5000+ TPS.
- Instrumented services with Splunk and structured logging, correlating traces across authorization and federation layers to shorten incident root-cause analysis.

Vensoft — Software Developer

Sept 2024 – April 2025

- Developed Java and Spring backend services for enterprise data pipelines, authoring Oracle PL/SQL procedures and tuning indexes to keep transformation workloads within SLA.
- Consumed Kafka topics to ingest streaming records into Oracle, enforcing schema validation and idempotent writes so replays and retries did not corrupt downstream state.
- Expanded automated test coverage with JUnit and Mockito across data-access and transformation layers, catching regressions before they reached production.

Accenture — Software Engineer

April 2021 – July 2022

- Developed RESTful microservices with Spring Boot, decomposing monolithic modules into independently deployable services to improve scalability and maintainability.
- Configured Spring Cloud service discovery and API gateway routing, removing hardcoded endpoints so services could scale horizontally without client-side changes.
- Secured enterprise APIs using OAuth and JWT, enforcing authentication and authorization at the gateway and service layers.
- Optimized data access with Spring Data JPA, restructuring queries and repository logic to reduce redundant database round-trips.
- Wrote unit and integration tests with JUnit 5 and Mockito, enforcing code quality through routine SonarQube static analysis.

PROJECTS

Daily Mental Wellness Companion | TypeScript, Next.js, Prisma, PostgreSQL, Google Gemini

- Built backend services and a 4-agent orchestration pipeline with rate limiting, input sanitization, and an access-controlled MCP server interface for external data queries.
- Engineered LLM prompt chains and structured output parsing to extract mood and sleep signals from conversational check-ins, generating recommendations from 14-day trend analysis.

EDUCATION

University of North Texas — M.S., Information Systems and Technology

CGPA 3.5

Aug 2022 – May 2024

Denton, TX
